

Jute Mesh

Open Weave Erosion Control Mesh

Description

Jute Mesh is an organic, flexible, loose-woven jute 'cargo-net' mesh used for erosion control and seed establishment.

An inexpensive and flexible product, **Jute Mesh** is easily separated so as to fall around existing vegetation. The coarse nature of the fibres assist in capturing wind-blown soil and native seeds.

Applications

A grass establishment and erosion control matting ideal for:

- Grass and vegetation establishment.
- Swale drains.
- Sand dunes.
- Coastal sites.
- Mulch retention.
- Natural regeneration sites.
- Wind erosion.
- Mine sites.
- Steep batters.
- Rough sites.
- Not suitable on highly erodible or high water flow sites.

Field Tip

Jute Mesh can be separated so as to be laid to accommodate existing vegetation.

Benefits

Natural Rehabilitation

Jute Mesh is ideal for areas where natural revegetation is being encouraged, such as sand dunes. It can be used along with local brush and twigs to help in capturing soil and seed, preventing soil erosion.

Retains Moisture

Jute Mesh retains moisture in the micro-environment for the plants, increases water infiltration for faster long-term stabilisation and helps increase germination rates for direct-seeded areas.

Cost-effective

Jute Mesh provides economical erosion treatment, applicable to large-scale land areas.

100% Organic

Jute Mesh adds organic matter to the soil as it degrades.

Specifications

Name	Jute Mesh
Material	Jute (rope) woven mesh.
Life Expectancy	Approximately 12 months.
Pinning Rate	2-3 pins per m ² .

Roll size	Weight per bale	Product weight	Product thickness	Life expectancy
1.22 x 549m (669.78m ²)	± 335kg	± 500 g/m ²	± 5mm	12 months
